DETAILED ACTION

Allowable Subject Matter

1. Claim 1, 2, 4, 5, 7, 24, 25, 28-36, 38 and 41-47 are allowed.

Reason for Allowance

2. The following is an examiner's statement of reasons for allowance:

The prior art of record does not teach the following:

In regards to claim 1 the prior art does not teach monitoring, at a network device disposed on a communication path between a first network and a second network and operating in an unconfigured mode, messages transmitted from the first network to the second network; upon detecting at the network device a message transmitted from the first network to the second network, determining whether the message is a configuration message based on whether the message is a null service type Resource ReSerVation Protocol (RSVP) message; if the message is not a configuration message, then forwarding, at the network device, the message to the second network; if the message is a configuration message that comprises an Internet Protocol (IP) address for the network device and an IP address of a network management system disposed in the first network, then configuring, at the network device, the network device with the IP address for the network device; and switching the network device to a configured mode.

In regards to claim 24 the prior art does not teach monitoring, at a network device disposed on a communication path between a first network and a second network and operating in an unconfigured mode, messages transmitted from the first network to the

second network; upon detecting a message transmitted from the first network to the second network at the network device, determining whether the message is a configuration message based on whether the message is a null service type Resource ReSerVation Protocol (RSVP) message; if the message is not a configuration message, then forwarding, at the network device, the message to the second network; and if the message is a configuration message that comprises configuration information for the network device, then validating the configuration message, if the configuration message is valid, then configuring the network device using the configuration information, and if the configuration message is invalid, then forwarding, at the network device, the configuration message to the second network.

In regards to claim 34 the prior art does not teach receiving, at a first network interface of a network device disposed on a communication path between a first network and a second network and operating in an unconfigured mode, a configuration message transmitted from the first network to the second network, the network device is null-service-enabled, the configuration message is a null service type Resource ReSerVation Protocol (RSVP) message, and the configuration message comprises configuration information for the network device; validating, at the network device, the configuration message; if the configuration message is valid, then configuring the network device using the configuration information in the configuration message; and if the configuration message is not valid, then passing the configuration message to the second network interface for forwarding to the second network.

In regards to claim 36 the prior art does not teach receive, at the first network interface, a configuration message transmitted from a first network to a second network by a network management system disposed in the first network and addressed to a configured destination host having a network address disposed in the second network, wherein the network device is disposed on a communication path between the first network and the second network; validate the configuration message; if the configuration message is valid, then invoke the configuration interface module to configure the network device using configuration information in the configuration message; and if the configuration message is not valid, then pass the configuration message to the second network interface for forwarding to the destination host.

In regards to claim 41 the prior art does not teach a network device disposed on a communication path between the first network and the second network, wherein the first network includes a gateway router allowing access to resources on at least the second network, and the network device, when operating in an unconfigured mode, is capable of intercepting messages transmitted from the second network to the first network, identifying a destination host on the first network, wherein the destination host is configured, has a network address, and is accessible to the resources on at least the second network, and the network device is unconfigured and inaccessible to the resources on at least the second network; transmitting a configuration message from the second network to the first network, wherein the configuration message is addressed to the destination host, and is used for

automatically configuring the network device after being intercepted by the network device.

The prior art alone or in combination fails to jointly suggest or teach the claimed combination of features as taught by the instant application. Therefore claims 1, 2, 4, 5, 7, 24, 25, 28-36, 38 and 41-47 are to be deemed allowable over prior art.
